Thermal Solutions – Made in Germany

Detecting Temperature Ranges with MOBOTIX TR Technology

More and more companies, authorities and institutions use MOBOTIX thermal technology as a proactive warning system. MOBOTIX TR (Thermal Radiometry) technology allows you to measure thermal radiation in the entire image area and assign a temperature value to each pixel.

Detection of persons/objects

Display of temperature differences from 0.1°C

Alarm in case of exceeding or falling below defined temperature ranges

Event Triggers (alarm, network message, activation of a switching output)

Screening via special TR windows or the complete sensor image

Temperature range from -40 to +550 °C

Awesome assistant! MOBOTIX thermal technology can help analyze critical situations which can be used to initiate further measures. The accuracy is increased through the use of a black body radiator. MOBOTIX thermal solutions are not medical devices.
